

Research on vulnerability assessment process and implementation of remediation solutions for server service systems.

Chu Hong Linh

Abstract: This topic focuses on the necessity of security vulnerability assessment in current service server systems, with the goal of building an effective evaluation process and implementing remediation solutions. The research method combines theory and experimentation to enhance information protection levels. The expected outcome of this topic is to provide organizations with an effective security assessment system, contributing to the construction of a sustainable and secure network environment.

Keywords: Server security, Vulnerability assessment, Remediation solutions, Service system, Experimental procedure
