

Design and administration of the network system for the Thai Nguyen University Testing Center

Nguyen Ngoc Duc Toan

Abstract: In the context of the increasing demand for information technology usage at examination centers, this topic focuses on designing and managing an efficient network system for the Thai Nguyen University Examination Center. The project aims to ensure stability, security, and optimized data transmission speed to effectively serve examination activities. Through theoretical and experimental research, the topic is expected to propose suitable technical solutions to enhance the network management capacity of the center. This not only meets current needs but also aims for sustainable development in the future.

Keywords: Network system, Network administration, Testing center
