

Building a site-to-site VPN system for FPT Tower, Hanoi.

Nguyen Thi Huong Giang

Abstract: This topic focuses on building a site-to-site Virtual Private Network (VPN) system to secure and optimize connections between the branches of FPT Tower in Hanoi. The context for proposing this topic stems from the practical need to ensure information security in corporate network communication. The objective of the research is to identify requirements, design, and deploy the system by combining network theory and experimental techniques. Expected results include an effective network solution that enhances synchronized communication between branches. This topic makes an important contribution to improving network security and operational performance within the corporate network structure.

Keywords: Virtual Private Network, FPT Tower, cybersecurity, site-to-site network, application deployment
