

Building the K'Food food ordering application on Android.

Nguyen Trung Kien

Abstract: In the context of the rapidly growing F&B; industry and the rise of online transactions, this topic focuses on building a mobile food ordering application named K'Food for the Android operating system. The objective of the research is to create an effective technical solution to meet the increasing demand for convenient and flexible food ordering services. The applied methods include technology analysis, user-friendly interface design (UI/UX), and implementation of key features through Android programming. The expected result is to provide an easy-to-use food ordering platform for both customers and restaurants, thereby contributing to the development of online business in the F&B; industry in Vietnam.
