

Building software for household registration management to serve population management work in Thai Nguyen province.

Phan Nhu Phuong

Abstract: In the current context, the management of household registration and population needs to be carried out more efficiently and scientifically. This project aims to build a household registration management software system to serve population management in Thai Nguyen province. Through research and analysis, the project applies a combination of theoretical and experimental methods to develop an information technology application solution. The project aims to improve work productivity, reduce the burden on staff, and enhance the quality of local population management.
