

Build a shoe sales website using PHP

Nguyen Van Doan

Abstract: In the context of rapidly developing online business, building a shoe sales website system is extremely necessary. This project aims to build an e-commerce website that ensures outstanding features, a user-friendly interface, and easy product information management. The research method is based on both theoretical approaches to PHP web application development and practical implementation of the application in a real environment. The expected results of the project will bring high practical value, contributing to promoting online business activities and improving product management efficiency.

Keywords: Shoe selling website, PHP, web development, user interface, product management
