

Build a fast food website Good food using JavaScript

Tô Văn Hùng

Abstract: This topic focuses on building an e-commerce website system specializing in selling various types of fast food. With the goal of providing a convenient solution for customers and efficient management for sellers, the topic applies the JavaScript programming language to develop an intuitive user interface. Through a process of theoretical research combined with experimentation, the project has created a system that meets the diverse needs of the modern market and contributes to the popularization of web technology in the field of culinary services.

Keywords: E-commerce website, JavaScript, Fast food, Culinary service, Web technology
