

Building an Ogani e-commerce system on the web with Python and the Django library.

Pham Van Thu

Abstract: This topic focuses on building an e-commerce system for Ogani company on a web platform, using the Python programming language combined with the Django library. The research context is based on the rapid development of e-commerce and the need to optimize Ogani's online sales process. The objective is to create an efficient management system for business operations such as product management, ordering, and payment. The research method is based on a combination of software development theory with practical application building experiments. Through this, the topic expects to provide a flexible and efficient solution to support Ogani's online business while contributing to the research field of e-commerce systems.

Keywords: e-commerce, Python, Django, sales management, web application development
