

Building a mobile ordering application for some domestic Chinese goods using the React Native framework

Lu Jun'an

Abstract: In the context of the strong growth of e-commerce in China, building a mobile application for ordering domestic goods is considered an essential need. This topic focuses on developing an ordering system on a mobile platform based on the React Native Framework. The main objective of the research is to create a convenient solution for users and businesses, thereby enhancing business efficiency in the e-commerce sector. The approach will include theoretical research combined with experimentation to deploy the application. The expected outcome of the topic is not only a modern technological product but also a contribution to expanding the market of domestic retailers in China.

Keywords: React Native, e-commerce, mobile ordering system
