

Research on qradar solution applied to system monitoring

Nguyen Hoang Anh

Abstract: This topic addresses the necessity of deploying a QRadar solution to optimize the information system monitoring process. The main objective is to build and deploy an effective monitoring system based on the QRadar solution, aiming to ensure information security and the stable operation of the system. By applying a research method combining theory and experimentation, the topic aims to contribute to the field of information system management, as well as provide system administrators with a powerful support tool in the process of monitoring and incident detection. The expected results of the study will not only enhance monitoring capabilities but also create significant technical and managerial improvements.

Keywords: QRadar, system monitoring, information security, system management, incident detection
