

Build a hotel management website using ASP.NET MVC

Trương Thị Lan Anh

Abstract: This topic focuses on developing a web-based hotel management system using ASP.NET MVC to optimize operational processes and enhance the experience of both staff and customers. Through practical research on modern hotel management needs, the topic identifies the main goal of building a system that automates functions such as booking, payment, and revenue reporting. The implementation method includes applying the principles of ASP.NET MVC to design a user-friendly interface and a robust backend. The system is expected to deliver higher management efficiency and support intelligent business decision-making.

Keywords: Hotel management website, ASP.NET MVC, booking management, process automation, revenue reporting
