

Automated testing of the external quality management website for Hanoi Lung Hospital

Hoang Thi Hau

Abstract: In the context of healthcare increasingly demanding high accuracy and efficiency, this topic focuses on building an automated testing system for the external quality management website at lung hospitals. The objective of the study is to ensure reliability and standards in the quality control process of medical services. The applied method includes both theoretical and experimental research, helping to develop an effective automated testing system. The expected results will bring important contributions to improving management technology and enhancing the quality of medical services at the hospital.
