

Building a news management system for websites on the Laravel Framework

Nong Van Hoach

Abstract: In the context of increasing digitalization, building an effective news management system has become an urgent requirement for websites. This topic focuses on researching and implementing a news management system based on the Laravel Framework. The objective of the topic is to design and build a system that allows for efficient management, classification, and display of news information. The applied methods include both theoretical research on digital information management and practical application deployment in the Laravel environment. The expected results will provide a flexible and scalable solution for websites, contributing to improved content quality and user experience.

Keywords: News management system, Laravel framework, Digital website
