

Build an e-commerce website NIK using Laravel and Vue.js frameworks.

Vu Sinh Huy

Abstract: This topic focuses on designing and implementing an e-commerce system using advanced technologies such as Laravel as the backend framework and Vue.js for the frontend. The context of the topic is set against the strong development of e-commerce in Vietnam, which requires high flexibility and efficiency from a web system. The goal is to build a modern and user-friendly interface combined with robust data management capabilities on the server side. The research methodology includes analyzing requirements based on practical needs, designing interface prototypes, implementing code, and testing the system. The expected result is an e-commerce solution that can be widely applied, featuring convenient online shopping and efficient order management.

Keywords: Laravel, Vue.js, e-commerce, web design, order management
