

Building an online job search and recruitment support network

Hoang Ngoc Khuong

Abstract: In the context of an increasingly competitive labor market, building a network to support job searching and online recruitment has become an essential need. This project aims to develop a digital information system to optimize the job search process and attract suitable candidates. Through a combination of theoretical research and empirical experimentation, the project will provide a comprehensive solution ranging from analyzing career trends to managing candidate data. The expected outcome is an effective system that improves communication between employers and workers, contributing to the development of information technology in the human resources field.
