

Build an e-commerce website "PhoneStore" using Laravel framework

Vuong Van Nguyen

Abstract: This topic focuses on building a PhoneStore e-commerce system using Laravel as the platform. In the context of the strong development of online business, the issue of finding effective management solutions for mobile products has become urgent. The objective of the research is to design and implement a professional website interface that meets diverse sales needs and facilitates easy shopping for customers. The research methodology includes both theoretical analysis of modern e-commerce business models and experimentation with Laravel to build administrative functions and user interfaces. The expected result will provide a practical solution for managing product information, orders, and sales transactions in an e-commerce environment.

Keywords: E-commerce website, Laravel framework, Sales management, Online business
