

Building an online electronics trading website on the Spring Framework platform

Do Ai Quoc

Abstract: In the increasingly developing context of e-commerce, this topic focuses on building a web system that allows users to shop for and sell electronic products through the Spring Framework platform. The project's objective is to create an effective solution to meet inventory management needs and enhance customer experience. Through a combination of theoretical research and experimentation, this topic not only provides users with features such as fast product search and product reviews but also ensures the system is built with high security and easy scalability in the future. The project's results are expected to contribute to the development of e-commerce technology in Vietnam.
