

Build a job search support website using Laravel Framework

Trinh Quang Cao Son

Abstract: This topic focuses on building a web system to support job searching in order to meet the demand for information on available job positions. Through theoretical research combined with experimentation, the project applies Laravel Framework technology to develop a website with a user-friendly interface and effective search functionality. The project's objective is to create a convenient online platform that allows users to easily access job information and enables businesses to advertise their job openings. The implementation of this project not only contributes to the field of information technology but also brings practical benefits to the modern labor society.

Keywords: Web system, job search, Laravel Framework, information technology, online application
