

Building a student management system for Thai Nguyen University of Information and Communication Technology in C# language.

Pham Tu Anh

Abstract: In the context of modernizing management in educational organizations, this topic focuses on building a Student Management System (SMS) for Thai Nguyen University of Information and Communication Technology. This system is developed using the C# programming language, aiming to solve the problem of improving efficiency in tracking and managing students' personal and academic information. Combining theoretical and experimental research approaches, the topic contributes to improving the current technical infrastructure and enhancing management capacity through technology. The expected outcome of this system will be a comprehensive, flexible solution for Thai Nguyen University of Information and Communication Technology, while also opening up many potentials for widespread application in other areas of education and organizational administration.
