

Building an online music player application on the Android operating system

Tran Van Ba

Abstract: In the context of the increasing demand for online music streaming, this topic focuses on developing an online music streaming application on the Android platform. The objective of the research is to build an efficient system capable of providing a good audio experience for users through a friendly and fully functional interface. The research method combines theory with experimentation to ensure that the application not only operates stably but also meets modern user interface requirements. The expected results will confirm the feasibility of this application in providing a flexible and convenient online music streaming solution.
