

Building a learning website using the MERN stack

Do Van Hung

Abstract: In the context of the growing development of information technology and online education, this topic aims to build a web-based learning system based on the MERN architecture (MongoDB, Express.js, React.js, Node.js). This topic not only addresses the issue of providing an intuitive and interactive educational platform for students but also promotes self-directed learning. Through a combination of theoretical research and experimentation, the project will create a customizable and scalable system that effectively serves user needs. The ultimate goal is to contribute to the development of digital education and affirm its high practical applicability.

Keywords: MERN stack, learning web, online education
