

Build a fashion e-commerce website using ASP.NET Core and Angular

Le Xuan Nghia

Abstract: This topic focuses on designing and implementing an e-commerce web system for the fashion industry, based on the ASP.NET Core platform and an advanced user interface with Angular. The context of the topic arises from the strong development of e-commerce in the modern digital era. The objective of the research is to build a system that meets the needs of effective online shopping, while optimizing user experience through a dynamic and flexible interface. The research methodology includes studying the theory of related technologies, then applying them in practice to implement the web system. This topic not only provides a technical solution for the fashion sector but also makes a significant contribution to the development of the e-commerce industry.

Keywords: E-commerce, ASP.NET Core, Angular, Fashion, Web Design
