

Building an English vocabulary learning support application for children on mobile platforms.

Nguyen Viet Quang

Abstract: In the context of increasing demand for international communication, mastering English is an important factor for children. This topic focuses on building a mobile application to support the process of learning English vocabulary for children through modern and highly interactive teaching methods. The research methodology includes analyzing the current situation, designing user interfaces, and deploying the application on a mobile platform. The expected result is an effective learning solution that aligns with the trends of automated and personalized education.
