

Developing a sales application for a BBQ-Hotpot store using the React Native framework

Lam Van Quyet

Abstract: In the context of today's technological development, building a mobile application has become an important solution to enhance the business operations of stores. This topic focuses on developing a sales application for a BBQ-Hotpot store using the React Native framework. The main objective is to create an efficient management and sales system that meets the needs of both managers and customers. The research method includes a combination of theoretical and experimental research to design and deploy the application. The expected outcome of this topic is a product that can be applied in practice, contributing to improving the operational performance of the BBQ-Hotpot store.

Keywords: Mobile application, React Native, Sales management, Fast food business, Technology development
