

Build an automotive e-commerce website using PHP language.

Hong Van Tra

Abstract: This topic focuses on building an e-commerce system for the automotive industry using the PHP programming language. The research context is based on the rapid development of e-commerce and the increasing demand for digital platforms in the automotive sector. The objective of the topic is to build an e-commerce website for the automotive industry, helping sellers easily post vehicle information and buyers easily search for and compare products. By combining theoretical research with practical implementation, the topic aims to contribute to the field of e-commerce web application development in the automotive industry. The expected result is a professional website system that meets user requirements well and brings significant benefits to both sellers and buyers.

Keywords: e-commerce website, PHP, car, e-commerce, web development
