

Build a website for a technology sales shop using PHP language

Bui Duc Khang

Abstract: In the context of the increasingly growing online business landscape, this topic focuses on building an e-commerce web system specializing in technology products using the PHP programming language. The objective of the research is to create an effective and flexible technical solution to support technology shops in inventory management, product marketing, and providing online sales services. The implementation method is based on a combination of theoretical research on PHP and practical application deployment. The expected results from this topic will contribute to the development of the e-commerce field and enhance the competitiveness of technology enterprises.
