

Learn about the CodeIgniter Framework and build an online SIM card business website.

Tran Anh Tuan

Abstract: This study focuses on analyzing and implementing the CodeIgniter framework to build an online mobile number retail website. The context of the topic stems from the increasing demand in the sim number market, along with the trend of applying web technology in e-commerce services. The objective is to design and implement an efficient sim number management system that meets security requirements and provides an intuitive user interface. The research method combines analyzing CodeIgniter and practical implementation to build the website. The expected outcome of this topic is a professional online sim number retail solution, providing business owners and customers with easy and convenient sim management services.
