

Building a Thai Nguyen tourism website using PHP and MySQL.

Hoang Manh Cuong

Abstract: This topic focuses on building a tourism website management system for Thai Nguyen province, aiming to meet local tourism information needs. Through empirical research combined with web development theory, this project uses PHP and MySQL tools to create a user-friendly interface and an efficient database. The objective of the topic is to develop a system that supports tourism information management, thereby enhancing information accessibility for tourists and promoting the local tourism industry. The expected result is the creation of an intuitive and easy-to-use tourism website, contributing to the development of digital platforms in the tourism sector.
