

Building a library book management website for the University of Information Technology & Communication.

Bui Van Khai

Abstract: This project aims to build a library book management website system for the University of Information Technology and Communication, meeting the need for fast and efficient information access. Through theoretical research on library management and experimental implementation, the project proposes appropriate technical solutions to improve user experience in the process of managing and using books. The expected results will help enhance the quality of the library's information services and increase the efficiency of management operations.
