

Building a frost warning system based on the LORA platform.

Vu Xuan Truong

Abstract: In the context of increasingly complex weather changes, building a frost warning system is extremely necessary to mitigate risks and protect economic assets. This project aims to develop a system based on the LORA platform capable of collecting weather data and providing instant warnings to the community. By combining theoretical research with experimentation, the project hopes to contribute an advanced technical solution in the field of weather information and disaster management. The expected results will help improve the ability to respond to emergency situations related to frost.
