

Design of a food storage warehouse monitoring system.

Pham Trung Hieu

Abstract: In the context of the increasing demand for efficient and safe management of food storage warehouses, this topic focuses on designing and implementing an automatic monitoring system. The objective of the research is to build a system that optimizes warehouse management processes, ensuring the quality and freshness of food. Using a combination of theoretical analysis of IoT technology and practical application deployment, the topic aims to provide a comprehensive solution for food business operators. The expected results will contribute to improving productivity and minimizing losses during storage.

Keywords: Monitoring system, Food storage warehouse, IoT (Internet of Things), Production productivity, Information technology
