

Building a mobile learning application for young children

Chu Dinh Chieu

Abstract: In the current context, the use of mobile devices such as smartphones and tablets is increasingly common in families with young children. This topic focuses on building an educational application for children to support more effective learning through visual and fun interaction on mobile platforms. The objective of the topic is to develop an application system that meets children's learning needs while ensuring safety for users. The research method includes requirement analysis, user interface design, and experimental deployment of the application on popular mobile platforms. The topic is expected to provide a useful solution to improve the quality of education for young children while promoting the use of technology in the field of education.
