

Research on the application of RFA in the treatment of thyroid nodules

Ban Thi Hue Anh

Abstract: This topic focuses on researching and evaluating the effectiveness of Radiofrequency Ablation (RFA) in the treatment of thyroid nodules. The background of the topic is the urgent need to find non-surgical or minimally invasive surgical treatment methods for thyroid patients. The research objective aims to determine the scope of application of RFA, evaluate the efficacy and safety of this technique compared to traditional methods. The method combines theoretical and experimental research to verify the suitability of RFA in treating thyroid nodules. The expected results will provide a scientific basis for the widespread implementation of RFA, contributing to improving patients' quality of life.

Keywords: RFA, thyroid nodules, non-surgical treatment, clinical efficacy
