

Design of an automatic disinfection spray system for cars

Ta Viet Lam

Abstract: In the context of the pandemic, the issue of car cleaning and disinfection has become increasingly urgent. This topic focuses on designing and implementing an automatic disinfection spray system for cars, aiming to meet the need for safe and effective disinfection during vehicle use. The research method combines theory with experimentation to determine technical requirements and develop a suitable system. The expected result is a widely applicable solution that contributes to enhancing hygiene safety for drivers and passengers.
