

Deploy internet television network for Mandarin2 building

Nguyen Tien Si

Abstract: This topic aims to address the issue of Internet accessibility via the television system in the Mandarin2 building by deploying a connection network. By applying theoretical and experimental research methods, the topic will design and evaluate the performance of network solutions suitable for the specific requirements of the building. The expected outcome is to provide a sustainable and performance-optimized Internet television system for the entire building, thereby enhancing the digital experience of customers and employees.
