

Building a versatile communication system design for the farm.

Than Ngoc Sy

Abstract: In the context of the rapid development of information technology, building a versatile communication system for farms has become an urgent need to enhance agricultural management and production efficiency. This project aims to design and implement a communication system that combines traditional media and new technologies, meeting the requirements of integrating diverse data from various sources. Through theoretical and experimental research, the project will identify appropriate technical solutions to create an effective communication platform for farms. The results of the project not only improve information management capabilities but also contribute significantly to the modernization of Vietnamese agriculture.
