

Building a website to support finding shared rooms

Nguyen Van Hai

Abstract: In the context of the increasing demand for shared room rentals in major cities, this topic aims to address the difficulties in finding and managing shared accommodations by building a web system. Through a combination of theoretical research and experimentation, the project will develop a web application that supports tenants and landlords in conducting transactions easily, thereby creating a safe and convenient environment for both parties. The expected outcome of the project is not only to provide an effective technical solution but also to contribute to improving the shared living experience and housing management within the community.
