

Building a network administration process using the Windows Server network operating system for Japan Overseas Employment Joint Stock Company, Hanoi.

Phi Thi Tuyet

Abstract: In the current context, managing and securing information networks is a crucial factor for business operations. This topic aims to study the development of a network administration process using the Windows Server network operating system for the Japan Overseas Labor Export Joint Stock Company in Hanoi. The main objective of the topic is to optimize performance, security, and data recovery capabilities within the company's network environment. Through a combination of theoretical research and experimentation, the topic aims to provide a comprehensive network administration solution and enhance the enterprise's competitiveness. The expected results of the study will contribute to improving network administration processes in similar business organizations.
