

Building an online book sales website on the ASP.NET platform

Hoang Viet Dieu

Abstract: In the context of information technology development, building an online book sales website system plays an important role in expanding the market and serving consumers' shopping needs. This project aims to design and deploy a book sales website application based on the ASP.NET platform, meeting requirements for a user-friendly interface, high security, and efficient order processing. Through the research and development process, the project expects to achieve results that contribute to improving traditional sales processes, enhancing customer experience, and providing practical technical solutions for businesses in the book retail sector.

Keywords: Online book selling website, ASP.NET, user interface, information security, order management
