

Developing an application to track and protect Samsung smartphone models in retail stores.

Vuong Tung Duong

Abstract: In the context of increasing mobile device theft, this topic focuses on developing an application system to monitor and protect Samsung smartphone models in retail stores. The objective of the research is to build an effective solution to ensure security and manage product information. The research method combines analyzing requirements from real business practices with deploying a practical application to verify feasibility. The topic is expected to make important contributions to the field of mobile device security in retail stores, while promoting technological development in the consumer electronics industry.

Keywords: Monitoring application, Product protection, Samsung, Retail store, Mobile security
