

Build an electronic device business website

Dang Van Hiep

Abstract: In the context of fierce competition in the electronics retail market, building an e-commerce website system is an urgent need. This project aims to create an intuitive and user-friendly website that supports efficient management of products, orders, and customers. The research methodology includes requirements analysis, user interface design, code development, and system testing. The expected results will bring significant benefits to businesses by enhancing market accessibility and improving customer experience.
