

Building a Student Marketplace Website

Hoang Phuong Nam

Abstract: In the context of increasingly advanced digitalization, the necessity of an online trading system for students becomes clearer than ever. This project aims to build and deploy a student marketplace website to serve the buying and selling needs among members of the school community. Through theoretical research on web design, content management, and web application development combined with direct experimentation on the system, the project seeks to provide a sustainable solution for the circulation of goods among students. The expected results will not only contribute to improving transaction efficiency but also promote the internal economic development of the school.
