

Building a population management system for Ung Hoa District on the CodeIgniter framework.

Nguyen Duy Phong

Abstract: This topic aims to research and build a population management system in Ung Hoa District, Vietnam. With the goal of improving the efficiency of resident information management, the method applied combines theory and experimentation, based on the Codeigniter framework. The project implementation process will include steps for designing, building, and testing the system. The expected result is to provide an effective technical solution for local population management, while contributing to the development of information technology in the administrative-social field.

Keywords: Population management, Codeigniter framework, Ung Hoa District, information system, technical solution
