

Application of automated testing in testing e-commerce websites

Do Quyen

Abstract: This topic focuses on evaluating and implementing automated testing methods for e-commerce websites, aiming to enhance the efficiency and quality of the testing process. Through practical needs analysis and theoretical research, the topic identifies technical requirements and builds a testing system based on a risk management process. The expected outcome is to provide a useful solution for e-commerce organizations, contributing to the improvement of digital product quality.

Keywords: automated testing, online business website, risk management, testing system, digital product quality
