

Building an online music streaming application on the Android operating system platform.

Bui Cao Son

Abstract: In the context of the increasing demand for online music streaming, this topic focuses on building a music player application on the Android platform. The main objective of the research is to provide users with a high-quality audio experience and a convenient user interface. Through the process of requirements analysis, system design, and application deployment, the topic has applied modern techniques in mobile development to ensure optimal performance. The research results contribute to diversifying music streaming solutions on the Android platform, while reflecting the development trend of online audio technology in Vietnam.

Keywords: Android application, Mobile development, Online music
