

Build a website selling used phones for CTQ shop.

Nguyen Thanh Duy

Abstract: In the context of the increasingly developing mobile retail market, building a specialized website system for selling used phones has become essential to enhance business efficiency and customer shopping experience. This project aims to design and deploy a web platform suitable for the CTQ shop, meeting requirements for inventory management, product classification based on technical condition and market value, while optimizing the buying and selling process through a user-friendly interface and advanced search features. The research methodology combines a survey of e-commerce website development trends with direct experimentation to build and test the system. The project is expected to bring value not only to CTQ shop by enhancing its market competitiveness but also to contribute to related research on supply chain management and mobile retail.
