

Building a real estate listing website

Nguyen Tien Tung Duong

Abstract: In the context of the rapidly growing real estate market, building an effective website system for posting buy and sell listings has become an urgent requirement. This project aims to research and implement web technology applications to create a transparent information platform for both real estate buyers and sellers. Throughout the implementation process, we apply a method combining programming theory with modern website construction techniques. The expected results will contribute to enhancing transaction efficiency and creating more favorable conditions for business activities in the real estate sector.
