

Building an online shopping application

Vu Hai Duong

Abstract: This topic focuses on building an online shopping application with the goal of meeting the increasing consumer demand for shopping via the internet. Through a combination of theoretical research and experimentation, the topic aims to analyze key factors such as a user-friendly interface, a secure payment system, and efficient shipping services. The expected result is an online shopping application that optimizes the customer experience while creating a new technological solution for e-commerce businesses.

Keywords: Online shopping application, Information technology, E-commerce, User interface, Payment system
