

Building a remote mobile device control application for the iOS operating system

La Van Hai

Abstract: In the increasingly prevalent context of mobile technology, this topic focuses on building a remote device control application for the iOS operating system. The goal is to create a safe and effective solution that allows users to manage mobile devices from any location. The research method combines iOS programming theory with experimentation to implement the application. The expected result will provide a useful tool, meeting the practical needs of users and contributing to the development of the mobile ecosystem.

Keywords: iOS application, Remote control, Mobile operating system, Application development, Information security
