

Learn about React js and build a warehouse management website for the clothing shop "Student"

Nguyen Van Kien

Abstract: In this study, we examined the necessity of applying ReactJS technology to improve the inventory management process at clothing stores. The main objective is to build a web system for managing product and warehouse information in order to optimize business operational efficiency. Through the research process, we applied a combined method of practical analysis and source code implementation to develop the application. The project results not only provide an effective technical solution but also make a significant contribution to improving work productivity in the enterprise.
